

Abstract

A chip sorting apparatus and a method for fabricating the same are applicable to the chip pick-up sorting process after chip formation. By
5 using the chip sorting apparatus and the method for fabricating the same in the chip pick-up process, it can directly inspect the chip without multiple chip movements for implementing the chip inspection. The chip sorting apparatus and the method for fabricating the same use a positioning axis to directly process inspection on the chip before picking
10 up the chip. This, therefore, can avoid the complicated process causing from multiple chip pick-up positions. Further, it can enhance the chip pick-up efficiency.
